

Mackerel (*Scomber scombrus*) in subareas 1–8 and 14, and in Division 9.a (Northeast Atlantic and adjacent waters)

ICES advice on fishing opportunities

ICES advises that when the MSY approach is applied, catches in 2024 should be no more than 739 386 tonnes.

ICES advice on conservation aspects

ICES has not identified any conservation aspects.

Stock development over time

Fishing pressure on the stock is above F_{MSY} but below F_{pa} and F_{lim} ; spawning-stock size is above MSY $B_{trigger}$, B_{pa} , and B_{lim} .

Figure 1 Mackerel in subareas 1–8 and 14, and in Division 9.a. Summary of the stock assessment. Catches prior to 2000 have been down-weighted in the assessment because of the considerable underreporting suspected to have taken place in this period. Abundance estimates of age 0 and 1 from the assessment model poorly reflect year-class strength and therefore recruitment is shown at age 2.

Conservation status

ICES is not aware of any information on stock-specific conservation status.

Catch scenarios

Table 1 Mackerel in subareas 1–8 and 14, and in Division 9.a. Values in the forecast and for the interim year.

Variable	Value	Notes
$F_{\text{ages } 4-8}$ (2023)	0.38	From the forecast for 2023, based on assumed catch in 2023
SSB (2023) at spawning time	3681064	From the forecast for 2023; tonnes
$R_{\text{age } 0}$ (2023–2024)	4498424	Geometric mean of the abundance at age 0 (1990–2021); thousands
Total catch (2023)	1147407	Sum of expected landings and discards, accounting for the interannual transfers from 2022; tonnes

Table 2 Mackerel in subareas 1–8 and 14, and in Division 9.a. Annual catch scenarios. All weights are in tonnes.

Basis	Total catch	$F_{\text{ages } 4-8}$	SSB at spawning time		% change

* SSB₂₀₂₅ relative to SSB₂₀₂₄.

** Catch in 2024 relative to estimated catches in 2023 (1 147 407 tonnes). There is no internationally agreed TAC for 2023.

*** Advice value for 2024 relative to the advice value for 2023 (782 066 tonnes).

^ SSB₂₀₂₅ values are the closest available approximation to B_{lim} and B_{pa}.

Basis of the advice

Table 3 Mackerel in subareas 1–8 and 14, and in Division 9.a. The basis of the advice.

Advice basis	MSY approach
Management plan	There is no long-term management strategy for Northeast Atlantic (NEA) mackerel agreed by all parties involved in the mackerel fishery. In 2019 Coastal State delegations from Norway, the EU, and the Faroes requested ICES to review new harvest control rule (HCR) options for a management strategy. ICES delivered the advice from this evaluation in August 2020 (ICES, 2020a).

Quality of the assessment

The recent assessments have systematically revised the estimates of SSB upwards and F downwards for the years prior to 2018 (Figure 2). Such systematic revisions do not happen for estimates of the most recent years in the assessment period, and the assessment results are more consistent.

The stock assessment and the short-term forecast include ages from 0 to 12. The abundance estimates at ages 0 and 1 are highly uncertain, and year-class strength only becomes apparent when fish enter the fishery at age 2 to 3. Therefore, recruitment is presented at age 2.

Figure 2 Mackerel in subareas 1–8 and 14, and in Division 9.a. Historical assessment results. Prior to the 2022 assessment, recruitment was presented as age 0 and is not shown.

Issues relevant for the advice

The sum of the unilateral quotas for mackerel and the resulting catches have exceeded the scientific advice by on average 44% since 2010. The F_{MSY} reference point that is used as a basis for the advice has been derived from an evaluation that assumed that annual catches would be aligned with the scientific advice based on the MSY approach. Therefore, failing to adhere to the advised catches as derived from the application of the MSY approach may not be precautionary. Specifically, this may result in an increased risk for the stock to fall below B_{lim} and loss of catch in the long term.

In 2023, ICES has reviewed the most recent evidence regarding mackerel stock structure and concluded that NEA mackerel is a single stock with no separate spawning components, rejecting the former perception that NEA mackerel was composed of three stock components (ICES, 2023c). Consequently, management measures to ensure the protection of the North Sea component have been shown to have no biological basis. In addition, there is no longer any reference to the North Sea, western, or southern component in the ICES advice, and the information on historic advice and TAC per component has been removed. The stock assessment assumes a single stock, and these changes have no impact on the stock assessment and catch advice.

Reference points

Table 4 Mackerel in subareas 1–8 and 14, and in Division 9.a. Reference points, values, and their technical basis.

Framework	Reference point	Value	Technical basis	Source
MSY approach	MSY $B_{trigger}$	2 580 000	B_{pa} ; tonnes	ICES (2020b)
	F_{MSY}	0.26	Stochastic simulations	ICES (2020b)
Precautionary approach	B_{lim}	2 000 000	B_{loss} in 2003 from the 2019 WGWISE assessment; tonnes	ICES (2020b)
	B_{pa}	2 580 000	$B_{lim} \times \exp(1.645 \times \sigma)$, $\sigma = 0.15$; tonnes	ICES (2020b)
	F_{lim}	0.46	The F that on average leads to B_{lim}	ICES (2020b)
	F_{pa}	0.36	The F that provides a 95% probability for SSB to be above B_{lim} (F_{P95})	ICES (2020b)

Basis of the assessment

Table 5 Mackerel in subareas 1–8 and 14, and in Division 9.a. Basis of the assessment and advice.

ICES stock data category	1 (ICES, 2023a)
Assessment type	Age-based analytical model (SAM).
Input data	Catch data, steel tagging data ([L3182] 1980–2006) and RFID tagging data ([L5543] 2014–2022), and three survey indices: SSB index from the triennial egg survey ([I4189] 1992–2022), abundance indices from the IBTS survey (G1022, G1179, G3239, G4299, G4493, G4748, G4815, G7212 and G9527) (combined Q1 and Q4; age 0, 1998–2020, 2022), and from the IESSNS survey ([A7806] ages 3–11, 2010, 2012–2023). Catches prior to 2000 are given a very low weight in the assessment. Natural mortality (0.15 for all ages and years) is based on tagging studies from the early 1980s.
Discards	Discarding is known to take place (0.3% of the total catch in weight in 2022), but is only quantified for part of the fisheries; the proportion of the landings covered cannot be calculated. Partial discard estimates are included in the assessment and overall discarding in recent years is assumed negligible.
Indicators	None
Other information	Interbenchmarked in 2019 (IBPNEAMac; ICES, 2019), a long-term management strategy evaluation was conducted in 2020 (WKMSEMAC; ICES 2020b)
Working group	Working Group on Widely Distributed Stocks (WGWide ; ICES 2023b)

History of the advice, catch, and management

Table 9 Mackerel in subareas 1–8 and 14, and in Division 9.a. Catches inside and outside the NEAFC regulatory areas (RAs), as estimated by ICES, as well as total catches. Weights are in tonnes.

Year	Inside the NEAFC RAs	Outside the NEAFC RAs	Total catch	Percentage inside the NEAFC RAs
2018	213608	809536	1023144	21
2019	207200	632527	839727	25
2020	247901	791612	1039513	24
2021*	195938	749427	945365	21
2022*	186199	758393	944591	20

* Without catches from the Russian Federation, as it did not report catches inside/outside the NEAFC RAs for 2021 and 2022. In the past, around 90% of Russian catches were taken inside the NEAFC RAs.

Summary of the assessment

Table 10 Mackerel in subareas 1–8 and 14, and in Division 9.a. Assessment summary. Weights are in tonnes and recruitment in thousands.
