Technical Report No.: 01-02

Tórshavn

September 2001

Introduction

This report documents 8 ADCP deployments in Faroese waters in 2000 – 2001 and 1 Aanderaa Current Meter record associated with one of the ADCP deployments. The measurements were acquired at 8 mooring sites (shown in Figure 1), of which 5 where standard sites. The deployments are listed in Table 1. Each deployment is identified by an 8-character label where the first four characters indicate the site (Fig. 1) while the last characters show year and month of deployment.

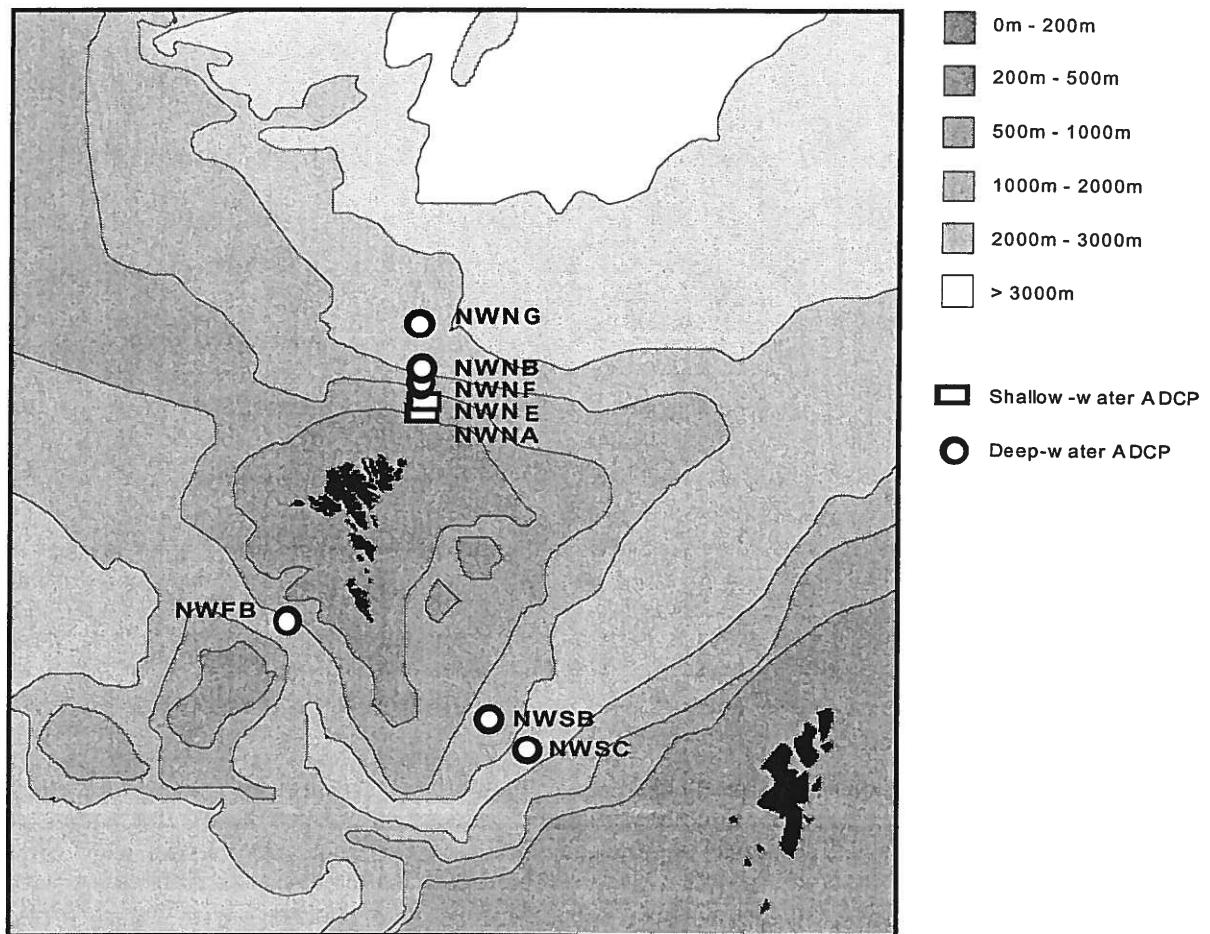

Figure 1. ADCP mooring sites in Faroese waters 2000-2001 superposed on a map with the bottom topography. Each site is indicated by a four-letter label. The sites NWFB, NWNA, NWNB, NWSB and NWSC are standard mooring sites.

As indicated in Figure 1, two types of moorings have been used. At site NWNA and NWNE, “shallow-water” rigs were used where 150 kHz RDI Broadband ADCP’s were placed on the bottom inside protective aluminium frames. At the other sites, 75 kHz RDI Broadband ADCP’s were placed in the top of single-point moorings (“deep-water” rigs). For each deployment the ADCP measures the velocity averaged over a number (15 – 25) of depth layers (“bins”) which were 25m for the deep-water rigs and the NWNE rig and 10m for the NWNA rig. At 20 minutes intervals the ADCP records the data from all bins into “ensembles”. In these deployments, each ensemble is based only upon one ping. At site NWNG and NWSC, an Aanderaa Current Meter was on the mooring line, but the NWNG record failed because of an instrument leakage. The Aanderaa Current Meter at NWSC recorded speed, direction, temperature and conductivity at 60 minute’s interval.

Table 1. List of ADCP deployments in 2000 with information on duration and range of valid data. The last column indicates for one deployment that one of the ADCP beams has been faulty and 3-beam computations have been used.

Quality control and calibration

The ADCP data have been quality controlled by a standard procedure based upon consideration of ADCP performance (error velocity etc.) and data variation with time in relation to neighbouring bins (spikes). The editing has been done manually using an interactive graphical software package developed by the Faroese Fisheries Laboratory (FFL), based upon MATLAB. Generally, the series have been edited up to the level where about 50% of the observations were found to be valid. Bins above this level have not been included.

The Aanderaa data have been calibrated using calibration data from the manufacturer. In the Aanderaa current meter, several speed and compass readings are taken during a sampling interval, while the temperature and conductivity readings are taken once at the end of the interval only. At the end of the interval, the instrument stores a vector average of the velocity for the whole sampling interval, as well as the temperature and conductivity readings. In the data file, the time of each record is the middle of the speed-averaging interval. In the calibration procedure the velocity direction has been corrected for magnetic deviation, by adding a constant. The actual correction for each deployment is stored in the header of the data file. The data have been quality controlled by a standard procedure based upon data variation with time in relation to neighbouring values (spikes). The editing has been done manually using an interactive graphical software package developed by the Faroese Fisheries Laboratory (FFL), based upon MATLAB. Salinity is not calibrated.

Report format

For each deployment, the report contains several pages, beginning with a page that has a drawing of the mooring and details of the deployment. After that there are some pages describing the ADCP data beginning with a page which for each bin lists the average speed (scalar average) and velocity magnitude and direction (vectorial average) as well as the fraction of "good" ensembles (in parts per thousand). On the next page there is a more detailed error statistics for the deployment which indicates also how many "long" (i.e. several consecutive ensembles) error gaps are for each bin. This is followed by a frequency distribution of speeds for each bin which lists the frequency (in parts per thousand) of speeds (scalar) exceeding specified values. Finally, for deployments exceeding 2 months, there are 2-3 pages listing tidal constituents. These pages contain 5 tables with data for the constituents M2, S2, N2, O1, and K1. Each table lists for each bin the amplitude and Greenwich phase lag for the east and north velocity components and lists also major and minor axes of the tidal ellipse for the constituent as well as its inclination (Fig. 2) and sense of rotation (cyclonic = C, anticyclonic = A). The tidal constants were computed by an adapted version of the Foreman FORTRAN package.

For site NWSC the report also contains some pages describing the Aanderaa Current Meter data. There is a text page listing metadata information in the header and showing the list of parameters in the data file with a tally of the number of records flagged and not flagged for error in each parameter. Any comments to the data are then listed. The rest of the text page describes features of the velocity observations in the series. First is shown the residual current, defined as the vectorial average of all non-flagged records. Next are shown the results of tidal analysis on the series. The number of records interpolated before the analysis is listed as well as the number that could not be interpolated (too large gap). Since all the deployments have 60 minutes intervals all analysis are performed on unfiltered data. 15 of the dominant constituents are listed and for each constituent, amplitude and Greenwich phase lag are shown for the east (E-ampl and E-gpl) and the north (N-ampl and N-gpl) velocity components respectively, followed by the characteristics of the tidal ellipse, its major and minor semi-axes, the inclination (Incl) of the ellipse, its Greenwich phase lag (Grphl), and whether it rotates cyclonically (C) or anticyclonically (A). The definitions of the tidal ellipse parameters are shown in figure 2. The tidal constants were computed by an adapted version of the Foreman FORTRAN package.

Finally, on the text page, is a table listing the directional current distribution as relative numbers of observations in parts per thousand. The table also lists for each direction interval, the relative flux, the average speed and the maximum speed. Then 2 pages show plots of the listed parameters as a function of time. Finally, there is a page showing the progressive vector diagram.

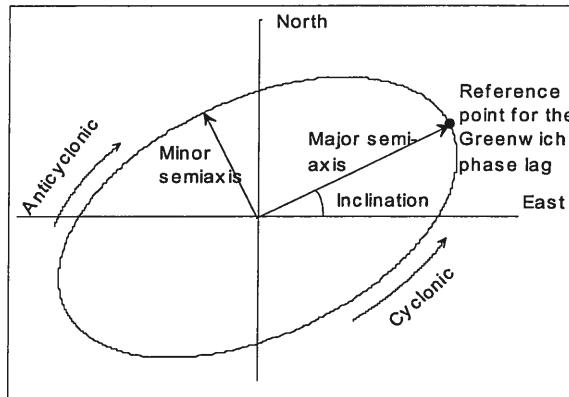

Figure 2. Parameters of the tidal ellipse for a given constituent. The reference point for the Greenwich phase lag is always chosen to be above the east-west axis.

 Number of acceptable velocity bins: 25
 Number of acceptable intensity bins: 25

Flagged values have been replaced by error codes: -999.99 for temperature, -999 for velocity and intensity. For observations where velocity is flagged, error codes have been inserted into speed, direction and vertical velocity files

Number of temperature ens. flagged: 0

Below are for each bin listed ensembles flagged for intensity in number and for velocity in number and % of total ens.number. For velocity is also shown the number of gaps of various lengths (gap length = number of consecutive flagged ens.)

Error statistics for deployment: NWNA0007 updated 2001/08/21

Surface distance invalid due to range limitation
 Heading, pitch and roll not edited
 Temperature edited by MCP in Jul 2001
 Velocity edited up to and including bin 25 by MCP in Jul 2001
 Intensity edited up to and including bin 28 by MCP in Jul 2001
 Velocity reedited from bin 19 up to bin 24 by KMHL in Aug 2001

Total number of ensembles: 24752
 Interval between ensembles: 20 min
 Original number of bins: 28
 Number of acceptable velocity bins: 24
 Number of acceptable intensity bins: 24

Flagged values have been replaced by error codes: -999.99 for temperature, -999 for velocity and intensity. For observations where velocity is flagged, error codes have been inserted into speed, direction and vertical velocity files

Number of temperature ens. flagged: 0

Below are for each bin listed ensembles flagged for intensity in number and for velocity in number and % of total ens.number. For velocity is also shown the number of gaps of various lengths (gap length = number of consecutive flagged ens.)

Error statistics for deployment: NWNB0007 updated 2001/08/16

Surface distance invalid due to range limitation
 Heading, pitch and roll not edited
 Temperature edited by MCP in Aug 2001
 Velocity edited up to and including bin 28 by GEJ in Jul 2001
 Intensity edited up to and including bin 28 by MCP in Aug 2001

Total number of ensembles: 24738
 Interval between ensembles: 20 min
 Original number of bins: 28
 Number of acceptable velocity bins: 24
 Number of acceptable intensity bins: 24

Flagged values have been replaced by error codes: -999.99 for temperature, -999 for velocity and intensity. For observations where velocity is flagged, error codes have been inserted into speed, direction and vertical velocity files

Number of temperature ens. flagged: 0

Below are for each bin listed ensembles flagged for intensity in number and for velocity in number and % of total ens.number. For velocity is also shown the number of gaps of various lengths (gap length = number of consecutive flagged ens.)

Total number of ensembles: 24723

Interval between ensembles: 20 min

Original number of bins: 28

Number of acceptable velocity bins: 22

Number of acceptable intensity bins: 22

Flagged values have been replaced by error codes: -999.99 for temperature, -999 for velocity and intensity. For observations where velocity is flagged, error codes have been inserted into speed, direction and vertical velocity files

Number of temperature ens. flagged: 0

Below are for each bin listed ensembles flagged for intensity in number and for velocity in number and % of total ens.number. For velocity is also shown the number of gaps of various lengths (gap length = number of consecutive flagged ens.)

Total number of ensembles: 24799
 Interval between ensembles: 20 min
 Original number of bins: 28
 Number of acceptable velocity bins: 23
 Number of acceptable intensity bins: 23

Flagged values have been replaced by error codes: -999.99 for temperature, -999 for velocity and intensity. For observations where velocity is flagged, error codes have been inserted into speed, direction and vertical velocity files

Number of temperature ens. flagged: 0

Below are for each bin listed ensembles flagged for intensity in number and for velocity in number and % of total ens.number. For velocity is also shown the number of gaps of various lengths (gap length = number of consecutive flagged ens.)
