

Haddock (*Melanogrammus aeglefinus*) in Division 5.b (Faroes grounds)

ICES advice on fishing opportunities

ICES advises that when the maximum sustainable yield (MSY) approach is applied, catches in 2025 should be no more than 12 204 tonnes. ICES is not in a position to advise on the corresponding level of fishing effort.

Non-fisheries conservation considerations

ICES has not identified any conservation aspects other than those relating to the commercial fisheries.

Stock development over time

Fishing pressure on the stock is above F_{MSY} and below F_{pa} and F_{lim} ; spawning-stock size is above MSY $B_{trigger}$, B_{pa} , and B_{lim}

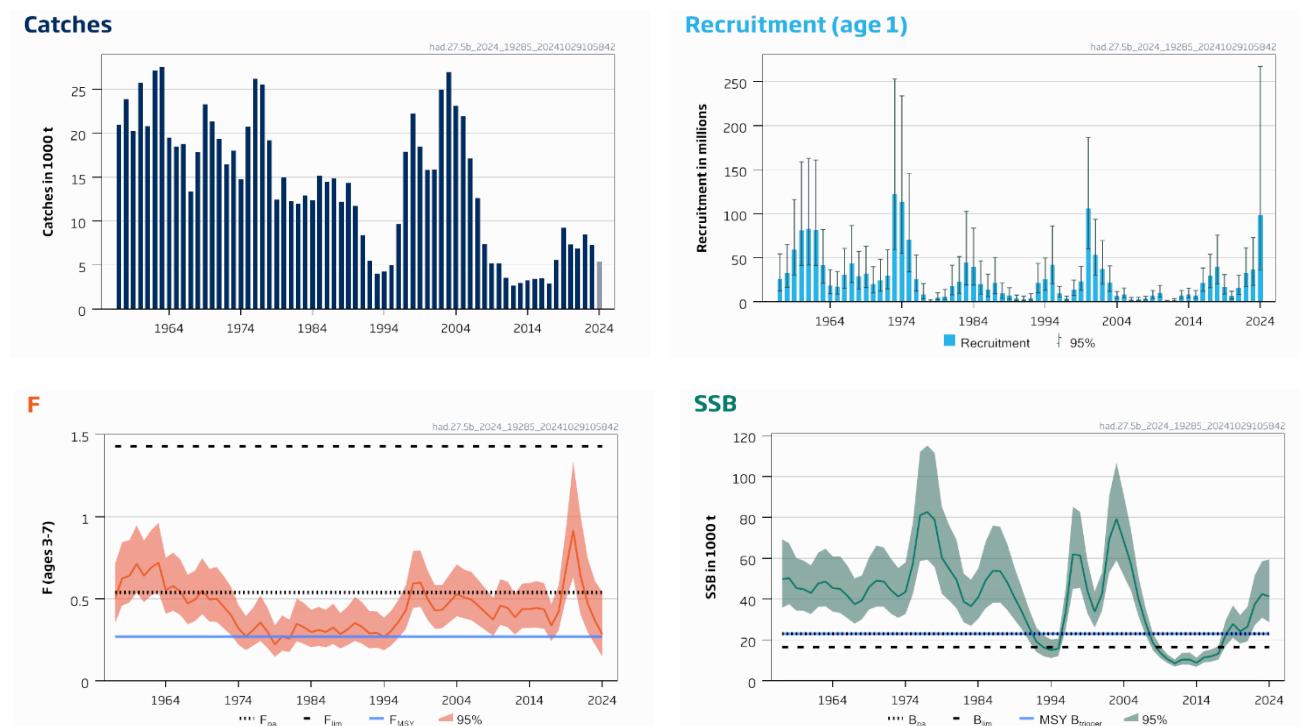

Figure 1 Haddock in Division 5.b (Faroes grounds). Summary of the stock assessment. Catches in 2024 are estimated for the full year based on reported catch in Q1–Q3, and used in the assessment to produce an estimate of F in 2024

Catch scenarios

Table 1 Haddock in Division 5.b (Faroes grounds). Assumptions made for the interim year and in the forecast.

Variable	Value	Notes
$F_{ages\ 3-7}\ (2024)$	0.28	Based on catch estimate of 5 388 tonnes in 2024
SSB (2025)	72 480	In tonnes
$R_{age\ 1}\ (2025)$	8 540	Median of resampled estimates from 2000–2023; in thousands

Variable	Value	Notes
Landings (2024)	5 388	Catch estimate for 2024 based on catch statistics to the end of September extrapolated to the entire year; in tonnes
Discards (2024)	0	Discard is considered negligible; in tonnes

Table 2 Haddock in Division 5.b (Faroes grounds). Annual catch scenarios. Weights are in tonnes.

Basis	Total catch (2025)	F _{ages 3–7} (2025)	SSB (2026)	% SSB change*	% advice change**
ICES advice basis					
Maximum sustainable yield (MSY) approach: F_{MSY}	12 204	0.27	106958	48	0.49
Other scenarios					
$F = 0$	0	0	122751	69	-100
$F = F_{2024}$	13087	0.29	105652	46	8
$F = F_{pa}$	20924	0.54	95766	32	72
$F = F_{lim}$	36667	1.43	76378	5	202

* SSB (2026) relative to SSB (2025) (72 480 tonnes).

** The advice value for 2025 relative to the advice value for 2024 as issued in 2023 (12 145 tonnes).

Basis of the advice

Table 3 Haddock in Division 5.b (Faroes grounds). The basis of the advice.

Advice basis	Maximum sustainable yield (MSY) approach
Management plan	A management plan (Fiskidagaskipan og umsitingaráætlan, 2019) was implemented in 2021, but ICES has not been requested to evaluate it

Quality of the assessment

The assessment of SSB and F in 2024 and 2023 indicates a trend for overestimating SSB and underestimating F. The estimate of recruitment for 2021 and 2022 has been revised upwards considerably and the recruitment of 2023 has been revised downwards.

The relationship between catches from January to September and total year catch gives a preliminary estimate of catch in 2024 that is well below the ICES advice.

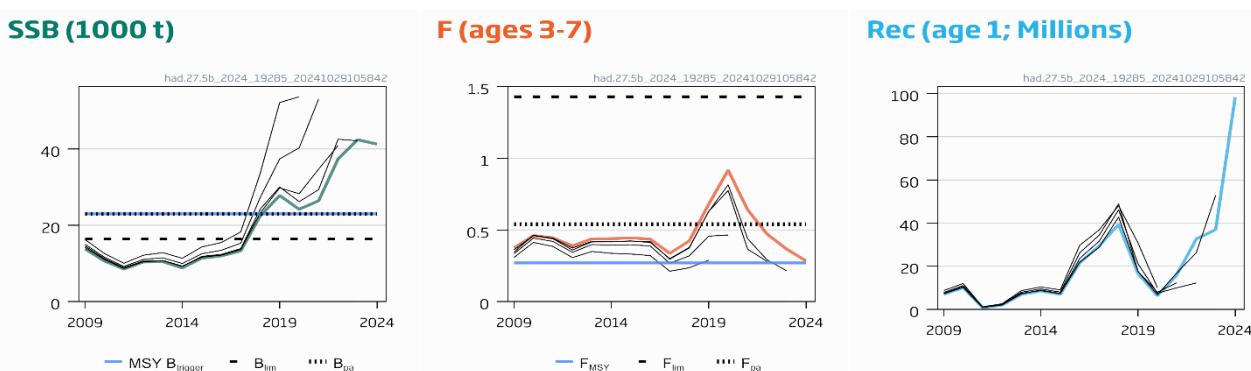

Figure 2 Haddock in Division 5.b (Faroes grounds). Historical assessment results. Results of the last five assessments are plotted, with the solid coloured line representing the current assessment. The plot does not show the line for fishing mortality that ends in 2021 because this year's assessment estimated fishing mortality in the current year (year y), while the last year in previous assessments was the last full calendar year (year y-1). The final year F in 2024 for the current assessment is based on estimated catch.

Issues relevant for the advice

Faroe Plateau cod and Faroe haddock are caught in a mixed fishery.

In 2021, the Faroese authorities implemented a management plan (Fiskidagaskipan og umsitingaráætlan, 2019) with a control rule that regulates the number of fishing days for cod, haddock, and saithe in the Faroe Plateau fishery. The management plan has not been evaluated by ICES; therefore, ICES bases its advice on the MSY approach.

ICES cannot quantify the relationship between effort and F for this stock.

Reference points

Table 4 Haddock in Division 5.b (Faroes grounds). Reference points, values, and their technical basis.

Framework	Reference point	Value	Technical basis	Source
Maximum sustainable yield (MSY) approach	MSY $B_{trigger}$	23 030 t	B_{pa}	ICES (2022)
	F_{MSY}	0.27	Stochastic simulations based on a segmented regression stock-recruitment relationship	ICES (2022)
Precautionary approach	B_{lim}	16 458 t	The lowest biomass that has led to good recruitment	ICES (2022)
	B_{pa}	23 030 t	$B_{lim} \times \exp(1.645 \times \sigma)$, where $\sigma = 0.204$	ICES (2022)
	F_{lim}	1.43	Stochastic simulations (ICES, 2022) that give a 50% probability of SSB > B_{lim}	ICES (2022)
	F_{pa}	0.54	F_{P95} ; the F that leads to SSB $\geq B_{lim}$ with 95% probability	ICES (2022)
Management plan	SSB _{mgt}	Not applicable		
	F_{mgt}	Not applicable		

Basis of the assessment

Table 5 Haddock in Division 5.b (Faroes grounds). Basis of the assessment and advice.

ICES stock data category	1 (ICES, 2023)
Assessment type	SAM with catch-at-age data and age-disaggregated indices, using catches in the model and in the forecast (ICES, 2024).
Input data	Commercial catches (mainly Faroese catches, ages and length frequencies from catch sampling); survey indices (FO-GFS-Q1 [G1264], and FO-GFS-Q3 [G3284]); annual maturity data from FO-GFS-Q1 (G1264); natural mortality set at 0.2. Preliminary estimate of catch-at-age in the year (January to September) in which the assessment is carried out
Discards and bycatch	Discarding is considered negligible
Indicators	None
Other information	Interbenchmark in 2022 (ICES, 2022)
Working group report	Northwestern Working Group (NWWG)

History of the advice, catch, and management

Table 6 Haddock in Division 5.b (Faroes grounds). ICES advice and catch. Weights are in tonnes.

Year	ICES advice	Catch corresponding to advice	Agreed total allowable catch (TAC)*	ICES catch
1987	No increase in F	17000		14882
